TESTIMONIALS FROM ASTRONOMERS.

SOME copies of the Tables contained in this volume were printed in 1895 and sent to a few leading astronomers in Great Britain, including Dr. Downing, Superintendent of the Nautical Almanac; Mr. Lynn, long connected with Greenwich Observatory; Dr. Dreyer, of Armagh Observatory, and Mr. Marth, of Markree Observatory. The following testimonials and letters from these astronomers express the results of their examination of the work. Dr. Downing's position, as appointed by Government to superintend the preparation of an annual volume of Astronomical Tables, containing 500 pages of important matter, Mr. Lynn's frequent and valuable contributions to astronomical literature, Dr. Dreyer's experience as formerly Editor of the Astronomical Journal "Copernicus," and as the author of various standard astronomical works, and Mr. Marth's widely known and almost unrivalled ability as a mathematician and astronomer, give ample value to their testimonies.

Testimonial from Dr. Dreyer, F.R.A.S.

"These Tables give the date, hour and minute of every new moon from the year B.C. 1622 to A.D. 1934, as well as the Dominical letters and the time of vernal equinox for every year of this period. Hitherto chronologists who required the time of any new moon have had to calculate it from Largeteau's Tables published in the *Connaissance des Temps pour l'an* 1846; or, if very great accuracy was required, by Oppolzer's *Syzygien-Tafeln für den mond* (Leipzig, 1881); but Dr. Guinness's Tables give the time of new moon by mere inspection without any calculation whatever. In his introduction the author illustrates the accuracy of

his tables by a comparison with the time of the first solar eclipse of each century, taken from Oppolzer's *Canon der Finsternisse*, and shows that his tables never differ from these more than two hours, while the differences frequently amount to only a few minutes.

“I have myself tested the Tables by means of a number of eclipses rigorously computed by Stockwell (eclipses observed in India B.C. 1386, 1301, 1250), by Schjellerup (B.C. 707, 599, and 547, observed in China), and by Newcomb (Arabian eclipses from the middle ages), and with the same result. *These Tables are therefore somewhat more accurate than those of Largeteau, and of course vastly more convenient, as they do not entail any calculation.*

“These Tables have been calculated by means of the luni-solar cycles discovered by the Swiss astronomer, De Cheseaux, about the middle of last century, but hitherto very little noticed by scientific men. The cyclical new moons thus found are given in the tables side by side with the true new moons obtained from them by equating for solar and lunar anomaly. Astronomers will be much interested in the remarkable accuracy obtained in this way by Dr. Guinness.

“The Tables will be of great practical value to chronologists and historians, who can find from them the day of the week and the age of the moon corresponding to any date. Particularly to students of Oriental history they will be invaluable, as the moon is the clock hand of Eastern nations. But they will also in many cases be of great use to astronomers as a ready means of finding, by a mere glance, the whereabouts of the moon in the sky at any time during the last three thousand years.

“J. L. E. DREYER.”

“ARMAGH OBSERVATORY,
April 8th, 1895.”

The above testimonial from Dr. Dreyer is reprinted from

the Introduction to Volume I., as some, into whose hands these Tables may come, will not possess a copy of the earlier volume.

**Testimonial from Dr. Downing, F.R.A.S., Superintendent
of the Nautical Almanac.**

NAUTICAL ALMANAC OFFICE,
3, VERULAM BUILDINGS, GRAY'S INN, W.C.,

DEAR SIR,—

March 23rd, 1895.

I have examined your volume of Astronomical Tables containing Dominical letters, Vernal Equinoxes and New and Full Moons for some thirty centuries. I think you have shown that De Cheseaux' cycles of 2300 and 1040 years (by means of which your times are deduced) are not only curiosities of astronomy, but are sufficiently accurate to be turned to practical use for the computation of the positions of the Sun and Moon at distant epochs. The comparison of your results with those of Oppolzer's *Canon der Finsternisse* and other authorities to which you refer in the introduction would of itself be sufficient to justify you in claiming a remarkable degree of accuracy for your Tables. But in addition to this I have examined a great number of your results, and find that a discordance of about three hours between your times and those computed from various Tables that were accessible to me, is the greatest discordance to be apprehended. For any purposes, therefore, for which an error of this magnitude in distant dates is immaterial, your Tables may be used with the greatest confidence.

You have made your Tables considerably more interesting and useful by giving, in addition to the times of Mean, New and Full Moon, those of True New and Full Moon, deduced from the former by the application of the two principal inequalities.

Yours faithfully,

A. M. W. DOWNING.

Letter from W. T. Lynn, Esq., F.R.A.S.

3, SOUTH VALE,
BLACKHEATH, S.E.,
March 25th, 1895.

DEAR SIR,—

I may now safely say that your New Tables are abundantly accurate for all historical and chronological purposes, in many of which they will doubtless be found very useful. They have evidently been computed with great care and accuracy, and the comparison with Oppolzer's Canon was a highly satisfactory check.

Yours very truly,
W. T. LYNN.

Letter from A. Marth, Esq., F.R.A.S.

MARKREE OBSERVATORY,
COLLOONEY, IRELAND,
March 16th, 1895.

DEAR DR. GUINNESS,—

Most gratefully I beg to acknowledge the receipt of your very kind letter and of your new book. As it happens we have been working in different portions of the same field, and I highly appreciate the thoroughness with which you have tilled your portion. As regards the chief aim you have at heart, the proving of Daniel's prophetic 2,300 days to refer to the soli-lunar cycle of 2,300 years, it would have been sufficient to give the list of comparisons on p. xvii. of your Tables. That Daniel's periods were not derived from his understanding science and being in possession of "the learning of the Chaldeans" is plain from the statement that he had to ask for the meaning of the vision including the times mentioned. But if it was not intended that the revelation should be understood till a late time, and that it should remain a dark mystery to some, you will have to

acquiesce in the failure of many truth-seekers to lift the veil. The bulk of your book enables astronomers to know the whereabouts of the moon at any time during these thousand of years. What I have been aiming at, but what I have not yet been able to accomplish except for a portion of that period, is to provide astronomers the data for finding the whereabouts of the old planets. If nothing too serious interferes with my working diligently at it during the next six or eight weeks I hope to get "a Table for finding by means of modern Ephemerides the whereabouts of the old planets during the six centuries A.D. 1400-2000, and also outside of these limits" ready and printed about midsummer. In comparison with your book it will be a tiny publication, the data for each year filling only a single line . . .

With grateful thanks,

Yours sincerely,

A. MARTH.

In a later letter Mr. Marth verifies the correctness of the new moons for the year B.C. 1622, the starting point of the Tables, by means of Schram's Tables. Employing Schram's data, and reducing to Jerusalem civil time, he finds the following:—

| | | | | <i>d</i> | <i>h</i> | <i>m</i> |
|------------|---------|-----------|--------|----------|----------|----------|
| B.C.—1622. | Schram. | New Moon. | April. | 5 | 3 | 1 |
| | Tables. | " | " | 5 | 3 | 38 |
| | Schram. | " | May. | 4 | 10 | 6 |
| | Tables. | " | " | 4 | 11 | 17 |
| | Schram. | " | June. | 2 | 18 | 7 |
| | Tables. | " | " | 2 | 20 | 2 |

The differences are slight for such distant dates computed by wholly different methods.

Mr. Marth has been kind enough to compute a Table by which the *mean* Vernal Equinoxes in this volume may be corrected for *true* Vernal Equinoxes. The differences are inconsiderable for the last twenty-five centuries, ranging in that period from 8 minutes to 1 h. 25 m. He has also calcu-

lated from Leverrier's Tables the length of the Tropical year at different dates, and it will be observed with interest that its length at the commencement of the Christian era, as thus deduced, 395 d. 5 h. 48 m. 56 s. corresponds exactly with its length according to the 1,040 years "Daniel cycle" discovered by De Cheseaux. Both these Tables by Mr. Marth will be found at the end of the Introduction.

I desire to acknowledge the kindness of Dr. Dreyer in reading the proof sheets of the astronomical portions of vol. i. while they were passing through the press. The following extract from one of his letters casts some additional light on the value and accuracy of the Tables.

"I certainly think that your Tables will be found very useful by historians and chronologists, at any rate I *know* that to me personally they will be extremely useful and convenient, as I am particularly fond of studying the history of astronomy, and have not infrequently missed a Table like yours. And it must be confessed that the lunar theory is not as yet in a sufficiently satisfactory state to enable us to calculate the places of the Moon for, say B.C. 1000, with a very much greater accuracy than that of your Tables. Whether ancient eclipses really give a much larger value for the secular acceleration than theory, is also very doubtful; from the mediæval ones Newcomb found only about 8."

I have never seen Cheseaux's book, but hope to see it the next time I am in Edinburgh, as I see there is a copy in the library of the R. Observatory, and I look forward with much interest to the reading of it.

"Once more thanking you for your kindness in presenting me with a copy of your valuable work.

"Believe me,

"Yours very truly,

"J. L. E. DREYER."

INTRODUCTION TO THE TABLES.

A knowledge of the dates of the new and full moons and vernal equinoxes is of primary value in the study of civil and sacred history and chronology.

In the Jewish Calendar the entire series of dates is dependent on the position of the Passover, which in its turn is regulated by the time of the full moon of the vernal equinox. Similarly all the dates in the Christian Ecclesiastical Calendar depend on the position of Easter, which is determined by the time of the first full moon following the vernal equinox. The Jewish feasts of Passover, Pentecost, Tabernacles, etc., were appointed to take place on certain days of the months measuring the sacred year, while these months were reckoned from the lunar phasis, or first appearance of the new moon. Without a knowledge of the exact times of new moons and vernal equinoxes it is impossible to fix or verify the dates of a great variety and multiplicity of events in the long course of Jewish and Christian history. On the other hand, such a knowledge is of considerable practical value in the study of civil history and chronology—Egyptian, Assyrian, Babylonish, Persian, Grecian, Roman, Mohammedan, Indian, Chinese, Early, Mediæval and Modern, in all of which both solar and lunar dates, especially the dates of eclipses, are of constant use and occurrence.

The following tables give the times of all the vernal equinoxes and new moons for 3,555 years, from B.C. 1622, the probable date of the Exodus, the starting point of the Jewish Calendar, to A.D. 1934. For the convenience of students of Sacred Chronology the solar and lunar dates are

stated in Jerusalem civil time, which is 2 h. 21 m. in advance of Greenwich time.

The times of the full moons of all lunar eclipses are added, from B.C. 1207 to A.D. 1934. As solar eclipses invariably coincide with new moons, no separate statement of these is presented. The observed or calculated times of solar and lunar eclipses can be employed to verify the correctness of the new and full moons of these tables. As a matter of fact the tables have been thus verified by a careful comparison with the records of eclipse chronology, and especially with the 12,348 solar and lunar eclipses in Oppolzer's invaluable *Canon der Finsternisse*, from B.C. 1207 to A.D. 1934.

The Dominical letter is given for every year, and a glance at the Dominical Tables appended to this introduction will be sufficient in order to ascertain the day of the week of any of the solar and lunar dates in the tables of equinoxes and new moons.

The method employed in calculating the Tables is as follows: the Tables are based upon the primary natural cycles adjusted to the correction of the Jewish and Christian Calendars.

1. Before their employment of the 19 years' Lunar cycle the Jews used the cycle of 84 years (7×12) in the regulation of their Calendar. The error of this cycle accumulates in 15 repetitions to an entire month. Hence *the primary natural cycle adjusted to its correction is 84×15 , or 1,260 tropical years*, a cycle in which the years and months very closely agree.

2. The Modern Jewish Calendar, especially as dating from Rabbi Hillel's Tables, A.D. 353, is based on the 19 years lunar cycle, which, as discovered by the Greek mathematician Meton, B.C. 432, still bears his name. The error of this cycle is so small (being only 2 h. 4 m.), as to give it an unrivalled position among the lesser lunar cycles, and to justify its employment as the foundation of the calendar in later Greek,

and Christian, as well as in Jewish chronology. *The primary natural cycle adjusted to the correction of the 19 years cycle is that of 2,300 years*, in which the error accumulates to between ten and eleven days, and thus equals the epact of a single year (employing the word “epact” in the sense of the excess of the tropical year above 12 synodic months). The 28,435 months of 121 Metonic cycles exceed 2,299 tropical years by 10 to 11 days, or the epact of the 2,300th year, and with the remaining 12 lunations of that year make 28,447 months, or 2,300 tropical years ; a cycle remarkable not only for the closeness of the agreement of months and years, but as the only secular cycle known.

3. The cyclical character of the periods of 1,260 and 2,300 years was discovered more than a century ago by the Swiss astronomer De Cheseaux, and also that *their difference, 1,040 years, forms the most accurate luni-solar cycle known*. De Cheseaux considered this cycle to be absolutely accurate as a cycle of the tropical year, synodic month, and solar day. More modern measures show it to have an error of about $1\frac{1}{2}$ hours ; but that error diminishes as we ascend the stream of past time, and disappears altogether at about the date of the Jewish captivity in Babylon, when the length of the solar year was six or seven seconds greater than it is at present ; in other words, 1,040 tropical years at the date of the Babylonish captivity very closely agreed with 12,863 lunations, and both with 379,852 solar days.

4. The 2,300 years cycle is not only a cycle of the tropical year and synodic month, but also (as was discovered in the preparation of the present tables) *a cycle of the anomalistic month*, the agreement being remarkable for its accuracy. The 840,057 days of 2,300 years are just 30,487 anomalistic months.

5. The 2,300 years cycle measures 40 days of the “annus magnus” of the revolution of the Solar Perigee with reference to the Equinoxes.

Employing these fundamental natural cycles as the basis of the construction of an extensive calendar, embracing the whole range of Jewish and Christian as well as the larger part of civil history, the problem we have worked out has taken the following form—*given these primary cycles; let it be required, to deduce from these a complete decursus of calendar times, solar and lunar, for the period of 3,555 years, from B.C. 1622 to A.D. 1934.*

The possibility of such a deduction owes its special interest and importance to the place which these cycles occupy in the volume of Revelation.

The deduction of the Tropical and Anomalistic years, and the Synodic and Anomalistic months from these cycles, is accomplished as follows:—

(1) *Tropical year.*

$$(a) \text{ by 2300 y. } 840057 \text{ d. } \div 2300 = 365.24217391 \text{ d.}$$

$$(b) \text{ by 1040 y. } 379852 \text{ d. } \div 1040 = 365.24230769 \text{ d.}$$

| | | | | | |
|------|---|---|---|---|----------------------------|
| Mean | . | . | . | . | 365.2422408 |
| | | | | | or 365 d. 5 h. 48 m. 49 s. |

(2) *Anomalistic year.*

By 2300 years cy. = 40 days of revol. of Perigee with reference to the Equinoxes.

$$40 \text{ d.} : 365.242 \text{ d.} :: 2300 \text{ y.} : 21000 \text{ y.}$$

$$\text{Trop. y.} + \frac{\text{Trop. y.}}{21000} = 365 \text{ d. } 6 \text{ h. } 13 \text{ m. } 52 \text{ s.}$$

(3) *Synodic month.*

$$\text{By 1040 y. cy. } 379852 \text{ d. } \div 12863 = 29 \text{ d. } 12 \text{ h. } 44 \text{ m. } 3 \text{ s.}$$

(4) *Anomalistic month.*

$$\text{By 2300 y. cy. } 840057 \text{ d. } \div 30487 = 27 \text{ d. } 13 \text{ h. } 18 \text{ m. } 37 \text{ s.}$$

From the foregoing values the Sun's mean anomaly and the Moon's mean anomaly have been obtained as follows:—

SUN'S MEAN ANOMALY.

$$\text{Sun's Mean Anomaly} = \frac{\text{Synodic month} \times 360}{\text{Tropical year.}} = \text{Long. of Perigee.}$$

$$2146021403340$$

With the values of the Sun's mean anomaly, and the Moon's mean anomaly thus obtained, the following tables have been calculated:—

(1) *For the present century.* The new moon of March, 1844, being taken as the starting point, or *terminus a quo* of the series.

(2) *For sixty centuries.*

OLD STYLE.

| Year. | Mean New Moon in March. Astron. Time. Long. Greenwich. | | | | Mean New Moon in March. Civil Time. Long. Jerusalem. | | | | Sun's Mean Anomaly. | | | Moon's Mean Anomaly. | | |

On the basis of the preceding Values and Tables the new moons for 3555 years, from B.C. 1622 to A.D. 1934 have been calculated, and also the full moons of all lunar eclipses from B.C. 1207 to A.D. 1934.

As a specimen of the calculation of the new moons, and of the full moons of lunar eclipses for a single year, the following for the year 1794 will show how the true moons have been obtained from the mean by simply twice equating for solar and lunar anomaly. The moon's mean anomaly has been used, and *not the equated anomaly*, as the error in using the mean anomaly is very small, and the saving of labour, in calculating such extensive tables, considerable. The eclipses in the margin are from Oppolzer's *Canon*, and were inserted in this way in the tables throughout, from B.C. 1207 to A.D. 1934, for purposes of comparison and verification. The *full moons* in the table are indicated by a small circle prefixed to their month dates.

| Year and Month. | Mean New Moon. (○ Full Ecl.) | Sun's Mean Anomaly. | Moon's Mean Anomaly. | First Equation. | Second Equation. | True New Moon. (○ Full Ecl.) | Eclipses from Oppolzer's Canon. |

CORRESPONDENCE OF DATES IN THE TABLES
WITH THOSE IN OPPOLZER'S "CANON."

As fairly illustrating the correspondence of the Tables in this volume with the eclipses in Oppolzer's *Canon der Finsternisse*, the following extract presents the first solar eclipse in each century, for 3,000 years, as given in Oppolzer's *Canon*, and the corresponding True New Moon of the Tables. As the latter are only twice equated, and calculated on somewhat different data from the new moons of Oppolzer's eclipses, they ought to differ from them; but *the mean difference is found to be less than an hour*. The accuracy of the Tables is thus sufficient for all ordinary historical and chronological purposes.

THE FIRST SOLAR ECLIPSE IN EACH CENTURY, FOR 3,000 YEARS;*

FROM B.C. 1100 TO A.D. 1900.

STATED IN JERUSALEM CIVIL TIME.

| Year. | Oppolzer's Canon, Sol. Ecl. | Tables, True New Moon. | Difference. |

* Printed 3-0-28 in Encyclop. Brit.

To find the mean and true new moons for past or future centuries from those of the present century given in the foregoing tables, it is only necessary to apply the century corrections, and take out the equations, as shown in the following calculation of the mean and true moons of March. 1744:—

| | MEAN NEW MOON. | SUN'S ANOMALY. | MOON'S ANOMALY. |
|---------------|----------------|----------------|-----------------|
| | d h m s | s ° ' | s ° ' |
| March, 1844 | 7 6 1 39 | 2 16 32 | 4 12 22 |
| 100 Years | 4 8 12 14 | 0 3 20 | 8 14 47 |
| <hr/> | | | |
| | 2. 21.49. 25 | 2 13 12 | 7 27 35 |
| 1st Equation | + 8 38 | | |
| 2nd Equation | + 4 3 | | |
| True New Moon | <hr/> | | |
| Mar., 1744 | 3. 10.30. 25. | | |
| | <hr/> | | |

To find the subsequent mean and true new moons for any particular year from those of the initial month of March, add the quantities given in the appropriate Table (Table of 13 lunations) to those of March, and take out the equations for the sun's and moon's anomaly. Example, to find the mean and true new moons for April, 1744:—

| | MEAN NEW MOON. | SUN'S ANOMALY. | MOON'S ANOMALY. |
|---------------|----------------|----------------|-----------------|
| | d h m s | s ° ' | s ° ' |
| Mar., 1744 | 2 21 49 25 | 2 13 12 | 7 27 35 |
| 1 Lunation | 29 12 44 3 | 0 29 6 | 0 25 49 |
| <hr/> | | | |
| April, | 1. 10.33. 28. | 3. 12. 18. | 8. 23. 24 |
| 1st Equation | + 9 50 | | |
| 2nd Equation | + 4 5 | | |
| True New Moon | <hr/> | | |
| April, 1744 | 2. 0. 28. | | |
| | <hr/> | | |

DOMINICAL LETTER TABLES.

The Dominical letter of each year is stated in the Tables of Equinoxes and New Moons. To find the day of the week ascertain from these the Dominical letter for the year, and in the Dominical letter Tables, under that letter, the required day of the week will be found.

EXAMPLE.—On what day of the week did April 5, the day of the vernal equinox and also of the new moon, fall, in B.C. 1622? In the Tables of Equinoxes and New Moons the Dominical letter for B.C. 1622 is G. Under the letter G in the Dominical Letter Tables April 5 is Thursday.

The Dominical letters can be employed as a test of the correctness of the tables, care being taken when B.C. and A.D. dates are compared to subtract one year.

Example: 2,300 years end one day of the week lower than the day on which they begin.

| | | | | | |
|-------------|--------------|----------------|------------|----------|------------|

| | { A.D. 1934. | " " | A. " " | Mar. 8. | Wednesday. |

VERIFICATION OF THE TABLES.

In the following Table, the 33 years Equinox cycle is employed to verify the vernal Equinoxes in this volume in a series of dates beginning B.C. 1622, and extending to A.D. 1910.

EXPLANATION OF THE CYCLE.

The Julian year of $365\frac{1}{4}$ days exceeds the Tropical year by 11 minutes 12 seconds. This fractional excess grows to 6 hours 9 minutes in 33 years. Instead of intercalating in the Calendar 1 day every 4 years, and 8 days in 32 years, it is more correct therefore to shift the 8th intercalation from the 32nd to the 33rd year. This is to drop the six hours' error of the Julian reckoning in that period. The error of the 33 years Equinox cycle is less than 9 minutes.

The regularity of the nearly 9 minutes differences in the Equinoxes (at intervals of 33 years) is conspicuous throughout the following Table. The number of days elapsed from the initial date of the Table is stated, as the accuracy of the Equinox cycle seems to warrant it, and the statement may prove serviceable in chronological calculations.

THE 33 YEARS EQUINOX CYCLE.

| No. | B.C. | Month. | d. h. m. | Days. | No. | A.D. | Month. | d. h. m. | Days. |
|-----|------|--------|----------|---------|-----|------|--------|----------|-----------|

USE OF THE TABLES.

1. *The primary use of the Tables is to fix particular dates.* Example:—What was the date of the new moon nearest to the vernal equinox in B.C. 457, the year in which, according to Sir Isaac Newton's calculation,¹ Ezra went up from Babylon to Jerusalem? The Tables show that the vernal equinox in B.C. 457 fell on March 26, and that the nearest new moon was that of March 25 d. 8 h. 45 m, Jerusalem Civil Time; and that, therefore, the Phasis, or first appearance of the new moon coincided with the date of the equinox.

As the Tables contain more than 100,000 solar and lunar dates, they afford the means of ascertaining or verifying a very large number of periods connected with sacred and civil chronology.

The solar and lunar dates in the Tables are the following:—3,555 vernal equinoxes; 43,969 mean new moons; 43,969 true new moons (together 87,938 new moons); 4,862 mean full moons; 4,862 true full moons (together 9,724 full moons); or 101,217 solar and lunar dates.

In ascertaining or verifying historic dates, eclipses have a special value. The Tables contain the dates of all lunar eclipses from April 22, B.C. 1207, to July 26, A.D. 1934. No separate statement of solar eclipses is given, but as these always exactly coincide with true new moons, their dates, when otherwise ascertained, may be confirmed by the Tables. The new and full moons of the Tables being stated in *Jerusalem Civil Time*, allowance must be made for this in comparing them with eclipses stated in Greenwich, or other

¹ An. J. P. 4,257. "Observations on the Prophecies of Daniel," p. 143.

local time, or in time as reckoned from noon. The following are some of the principal centres at which eclipses have been accurately observed, with the corrections which must be applied to the Tables in comparing other local time with that of Jerusalem.

| | Long. | Diff. of Time from Jerusalem. <i>h. m.</i> |
|----------------------------|------------|--|
| London—Greenwich | 0° 0' | —2 21 |
| Paris | 2° 24' E | —2 12 |
| Rome | 12° 30' E | —1 31 |
| Athens | 23° 44' E | —0 46 |
| Constantinople | 29° 0' E | —0 25 |
| Alexandria | 29° 52' E | —0 22 |
| Babylon | 44° 33' E | +0 37 |
| Canton | 113° 20' E | +5 12 |
| Pekin | 116° 20' E | +5 24 |

The following nineteen lunar eclipses recorded by Ptolemy establish the chronology of Babylonian, Persian, Grecian and Roman rulers for nine centuries. The names and periods of kings in Ptolemy's Canon extend from Nabonassar, B.C. 747, to Antoninus, A.D. 138. "The astronomic and the historic cannot be separated, and they must both stand or fall together. The astronomic can be rigidly verified, and the truth of the historic is a legitimate deduction."

ANCIENT CHINESE ECLIPSES.

The following thirty-six solar eclipses have a special value as verifying ancient Chinese history. They are taken from the *Chun Tsiu*, a history or chronicle of the kingdom of Lu, from B.C. 722 to B.C. 481, written by the celebrated philosopher Confucius. With the exception of four, all these eclipses have been verified. "That some error exists in these four is admitted by the Chinese themselves, but they attribute it to the transcribers, and not to Confucius. As the hour and quantity are not expressed they are less useful to the astronomer, but they are of immense value in authenticating the ancient Chinese history and determining its chronology."¹ We have taken the dates of these eclipses from Lindsay's "Chrono-Astrolabe." The correspondence of these dates with new moons in the *Tables* is interesting, and confirms both the eclipses and the *Tables*.

¹ J. B. Lindsay. "Chrono-Astrolabe," p. 98.

ANCIENT CHINESE ECLIPSES, FROM THE CHUN TSIU, OF CONFUCIUS.

| No. | | Date indicated. B.C. | New Moon. Tables. Jerusalem Civil Time. |
|-----|---|-------------------------|--|
| 1 | "In the year Sin-Yiu (the 58th of the cycle of 60) the 3rd of the Prince Yin Kung, in the season of spring, the 2nd moon, the day Ki-szi (being the 6th of the cycle of 60 days) the sun was eclipsed." | 720. Feb. 22 | d. h. m. Feb. . 22 1 43 |
| 2 | "In the year of the cycle Jin-Shin (the 9th) being the 3rd year of the Prince Hwan Kung, in autumn, the 7th moon, the day Jin-chin (29th) at new moon, the sun suffered a total eclipse." | 709. July 17 | July . 17 8 22 |
| 3 | "In the 17th year of Hwan Kung being ping-seuh (23rd of cycle) winter, the 10th moon, at new moon, the sun had an eclipse." | 695. Oct. 10 | Oct. . 10 10 35 |
| 4 | "In the year Yih-szi (42nd of the cycle) being the 18th of Chwang Kung, spring season, 3rd moon, the sun was eclipsed." | 676. April 15 | April. 15 10 9 |
| 5 | "In the year Jin-tsz (49th of the cycle). 25th year of Chwang Kung, beginning of the 6th moon, on the day Sin-wi (8th of the cycle of days) the sun had an eclipse." | 669. May 27 | May . 27 8 7 |
| 6 | "In the year Kwei-chau (50th of cycle), the 26th of Chwang Kung, winter, 12th moon, the day Kwei-hai (60th of cycle of days), the sun was eclipsed." | 668. Nov. 10 | Nov. . 10 6 11 |
| 7 | "In the 30th year of Chwang Kung, being Ting-szi (54th year of the cycle), on the first of the 9th moon, being the day Kang-wu (7th of the cycle of days), the sun was elipsed." | 664. Aug. 28 | Aug. . 28 8 20 |
| 8 | "In the year Ping-yin (3rd of the cycle), being the 5th of Hi Kung, the first of the 9th moon, the day Wu-shin (45th of the cycle of days), the sun was eclipsed." | 655. Aug. 19 | Aug. . 19 7 43 |

| N. | | Date indicated. B.C. | New Moon. Tables. Jerusalem Civil Time. |
|----|---|-------------------------|--|
| 9 | "In the year Kwei-yiu (10th of the cycle), being the 12th of Hi Kung, in the spring season, 3rd moon, on the day Kang-wu (7th of the cycle of days), the sun was eclipsed." | 648. April 6 | d. h. m. April. 6 9 39 |
| 10 | "In the year Ping-tsz (13th of the cycle), being the 15th of Hi Kung, in summer, the 5th moon, the sun was eclipsed." (Cannot be verified.) | 645. | |
| 11 | "In the year Yih-wi (32nd of the cycle), being the first of Wan Kung, in the 2nd moon, the day Kwei-hai (60th of the cycle of days), the sun was eclipsed." | 626. Feb. 3 | Feb. . 3 8 10 |
| 12 | "In the year Ki-yiu (46th of the cycle), the 15th of Wan Kung, on the first day of the 6th moon, being sin-chau (38th of the cycle of days), the sun was eclipsed." | 612. April 28 | April. 28 0 53 |
| 13 | "In the year Kang-shin (57th of the cycle), the 8th of Seuen Kung, autumn, 7th moon, the day Kia-tsz (1st of the cycle), the sun suffered a total eclipse." | 601. Sept. 20 | Sept. . 20 8 22 |
| 14 | "In the year Jin-Seuh (59th of the cycle), the 10th of Seuen Kung, summer, at the 4th moon, the day Ping-chin (53rd of the cycle), the sun was eclipsed." | 599. Mar. 6 | Mar. . 6 3 17 |
| 15 | "In the year Ki-szi (6th of the cycle), the 17th of Seuen Kung, at the 6th moon, the day Kwei-mao (40th of the cycle of days), the sun eclipsed." (Not verified.) | 592. | |
| 16 | "In the year Pingseuh (23rd of the cycle), the 16th of Ching Kung, at the beginning of the 6th moon, on the day Ping-yin (3rd of the cycle of days), the sun was eclipsed." | 575. May 9 | May . 9 7 43 |
| 17 | "In the year Ting-hai (24th of the cycle), the 17th of Ching Kung, the first day of the 12th moon, being Ting-szi (54th of the cycle), the sun was eclipsed." | 574. Oct. 22 | Oct. . 22 2 35 |
| 18 | "In the year Jin-yin (39th of the cycle), the 14th of Siang Kung, the 1st day of the 2nd moon, being Yih-wi (the 32nd of the cycle of days), the sun was eclipsed." | 559. Jan. 14 | Jan. . 14 9 14 |

| No. | | Date indicated. B.C. | New Moon. <i>Tables.</i> Jerusalem Civil Time. |
|-----|--|-------------------------|---|
| 19 | "In the year Kwei-mau (40th of the cycle), being the 15th of Siang Kung, autumn, the 8th moon, on the day Ting-szi (54th of the cycle of days), there was an eclipse of the sun." | 558. May 31 | <i>d. h. m.</i> May . 30 23 15 |
| 20 | "In the year Wu-shin (45th of the cycle), being the 20th of Siang Kung, in winter, the 1st day of the 10th moon, being Ping-chin (the 53rd of the cycle of days), the sun was eclipsed." | 553. Aug. 31 | Aug. . 31 11 3 |
| 21 | "In the year Ki-yiu (46th of the cycle), the 21st of Siang Kung, the 1st day of the 9th moon, being Kang-Seuh (47th of the cycle of days), the sun was eclipsed." | 552. Aug. 20 | Aug. . 20 11 23 |
| 22 | "In the year Ki-yiu (46th of the cycle), the 21st of Siang Kung, 1st day of 10th moon, being Kang-chin (17th of cycle), the sun eclipsed." (Not verified.) | | |
| 23 | "In the year Sin-hai (48th of the cycle), being the 23rd of Siang Kung, in the spring season, on the day Kwei-yiu (10th of the cycle of days), the sun was eclipsed." | 550. Jan. 5 | Jan. . 5 5 50 |
| 24 | "In the 24th year of Siang Kung, being Jin-tszi (49th of the cycle), autumn, beginning of the 7th moon, on the day Kia-tszi (1st of the cycle of days), the sun had a total eclipse." | 549. June 19 | June . 19 6 19 |
| 25 | "In the beginning of the 8th moon, on the day Kwei-szi (30th of the cycle of days), the sun was eclipsed." (Cannot be verified for day assigned.) | 549. July 18 | July . 18 13 20 |
| 26 | "In the 27th year of Siang Kung, being Yih-mao (52nd of the cycle), winter, beginning of the 12th moon, the day Yih-hai (12th of the cycle of days), the sun was eclipsed." | 546. Oct. 13 | Oct. . 13 2 13 |
| 27 | "In the 7th year of Chao-Kung, being Ping-yin (3rd of the cycle), summer, beginning of the 4th moon, on the day Kia-chin, the sun was eclipsed." | 535. Mar. 18 | Mar. . 18 7 15 |

| No. | | Date indicated. B.C. | New Moon. <i>Tables.</i> Jerusalem Civil Time. |

| 1460 | July 3. | 7.31 p.m. | " " | | July | 3 | 22 28 |

The Tables are of practical value, not only in confirming dates, but in the discovery of errors. The following errors in the list of eclipses given in Ferguson's "Astronomy" (taken professedly from Struyk and Ricciolus) have been discovered by a comparison of his dates with those in the Tables. In each of these instances the dates in the *Tables* are confirmed by Oppolzer's invaluable "Canon der Finsternisse."

ERRORS IN EQUINOX DATES AND DOMINICAL LETTERS.

Greswell's otherwise valuable Chronological Tables are wrong in their Julian Equinox dates and Dominical Letters from their commencement to the third century A.D. In the table which follows, it will be seen that while Greswell's dates agree on the whole with those in our *Tables from the third century A.D. onward*, they differ from them in all the preceding centuries. The error of Greswell's tables has been clearly demonstrated by Browne—*Ordo Sæclorum*, pp. 522–526—and by other chronologers.

2. *The second practical use of the Tables is in the ascertainment or verification of series of dates.*

The Tables possess a special value as casting a clear, direct light on the recorded dates of ancient and modern calendars, Jewish, Grecian, Roman, Christian, Mohammedan, etc. In illustration of the use of the Tables in the study of this branch of Chronology, we present, in the first place, specimens of the two principal Greek Calendars—the Octaëteris, or 8-years Calendar, and the Calendar of the celebrated Metonic Cycle (19-years Calendar), with the corresponding dates in the *Tables*. The Delphian Octaëteris is that given by Greswell in "*Origenes Kalendariæ Hellenicæ*," vol. vi., p. 666.

Many references occur in the writings of Josephus to dates connected with the history of the Jewish war. A list of these is given in Browne, "Ordo Sæclorum," p. 537-544, together with the following table of the Jewish and Syro-macedonian months in the years A.D. 66-70. These dates are confirmed, and to some extent corrected, by those in our *Tables*.

CANON OF S. HIPPOLYTUS.

The Octaëteris, or 8-years' lunar cycle, was one of the Paschal cycles in early use in the Christian Church. In the year A.D. 1551 was disinterred near the church of St. Laurence, at Rome, a marble monument of an ecclesiastic seated in a chair, on each side of which was an inscription in Greek; on the right side, a Paschal cycle beginning at the first year of Alexander Severus, with seven columns of dates; and on the left a table of corresponding Easter Sunday dates. The monument is preserved in the Vatican.

The exordium of the Canon is as follows:—"In the first year of the Emperor Alexander, the fourteenth of the Passover fell on the Ides of April, Saturday, the preceding year having received an intercalary month. In the succeeding years the day will be as is set down below in the Table. In the preceding years it fell as is here marked." The statue has been recognised as that of Hippolytus, Bishop of Portus, who wrote a treatise on the Passover, and constructed a 16-years Paschal cycle (the Octaëteris doubled).

We give here a copy of the Paschal Table of the monument. The first column contains the date of the 14th day of the Paschal moon, for 16 years, with the weekdays indicated by the first seven letters of the alphabet. The remaining columns contain only the weekdays, on the assumption that the Julian date recurs after a lapse of sixteen years. It is interesting to observe that the earliest Paschal limit in the Canon of Hippolytus is the 18th of March, which was, according to the *Acta Pilati*, the day of the Crucifixion, A.D. 29.

This venerable Christian calendar *is correct as to its weekdays throughout*, and also as to the coincidence of the full moon with its 14th day of the month *in the earlier entries*; but the later dates are out of harmony with the times of full moon, owing to the error of the 8-years' cycle, as will be seen by a comparison of the Julian dates in the first column of the Canon of Hippolytus, and those in the remaining columns, with the dates of the actual full moons from our lunar *Tables*. Thus, instead of the first date, April 13, being repeated in the years A.D. 222, 238, 254, 270, 286, 302, and 318, as in the Canon, the true dates of full moon in those years are April 14, 16, 19, 22, 26, 29, and May 2; the error growing with each repetition of the cycle, until it amounts to 18 days, and in its course making the Paschal *full* moon of the Canon of St. Hippolytus coincide with the *new* moon of the heavens. The error of the Canon in its *later*, and its correctness in its *earlier* dates, confirm the inscription it bears assigning its composition to the first year of the Emperor Alexander Severus, A.D. 222.

EPACT IN THE CHRISTIAN CALENDAR.

In our modern calendar the epact for the year is given. The application of the dates in the *Tables* to the Christian calendar of past times casts interesting light on the origin of the ecclesiastical use of epact, or the time when it was first introduced from the Greek into the Christian calendar.

A discovery of the errors of the Octaëteris, and other similar cycles, led to the employment of epact. In old style the epact was *the age of the moon* on the first possible location of Easter day, the 22nd of March; in new style epact means the age of the moon on the 1st of January. The excess of the solar year above the lunar is 10 d. 21 h. In case the new moon falls on the 1st of January, its age on the following 1st of January will be 10 d. 21 h., or 11 days. In the second year it will be double this, or 22 days; and in the third year treble, or 31–32 days; of this quantity $29\frac{1}{2}$ days will form an intercalary month, and the remaining 3 days will be the epact for the year.

In the course of the 19-years' lunar cycle, the epact for the contained years will be 11, 22, 3, 14, 25, 6, 17, 28, 9, 20, 1, 12, 23, 4, 15, 26, 7, 18, 29 days. In the following table *this series of epact amounts stands in the first column*, while the *true* age of the moon on the 22nd of March is shown in three 19-years' periods, separated by 532 years. (The period of 532 years consists of the 28-years' solar cycle of the week, multiplied by the 19-years' lunar cycle.) It will be seen that while a comparison of the epact quantities in the first column with the age of the moon in the *central* sixth century column reveals a correspondence, in the first century column the age of the moon on the 22nd of March falls *short* of the assigned epact by 2 days throughout, and in the eleventh century column the dates are 2 days in *excess*. The correspondence in the centre column indicates

the antiquity of the ecclesiastical calendar, and confirms the historical date of its origin.¹

¹ A simple and ingenious correction of the epact quantities employed in the calendar was proposed by Lullius, and adopted at the reformation of the calendar; it consisted of increasing the epact 1 day in 16 lunar cycles, or 304 years, or changing the epact series 11, 22, 3, etc., to 12, 23, 4, etc.

The lunar character of the Jewish Calendar is shown in the following table of the twelve months which constituted its year 5604, corresponding to Sept., 1843–Aug., 1844. The true new moons are from our Tables; and it will be noticed that the Jewish months fall a little later, and that they fairly agree with the dates of lunar phasis.

SOLAR AND LUNAR CYCLES.

3. Having shown the use of the *Tables* in the verification of particular dates, and of series of dates, it remains to exhibit their use *in tracing lunar and solar cycles*.

The 49-years' Jubilee cycle, employed in early times by the Jews, has an error which accumulates to 1 month in 22 Jubilees, or 1078 years. In the following table the accumulation of the error can be seen at a glance, and its correction in the 1078 years' cycle.

1078-YEARS' LUNAR CYCLE.

CORRECTING THE ERROR OF THE 49-YEARS' JUBILEE CYCLE.

We referred in the opening pages of this introduction to the 84-years' cycle employed at a later date by the Jews, and to the correction of its error in the period of 1260 years. In the subjoined table of this correction the agreement of the vernal equinox and mean new moon will be noticed at the beginning, the growth of the divergence to a month in the intervening dates, and the correspondence at the close.

We have already referred to the error of the 19-years' lunar cycle employed in the Greek, Jewish, and Christian Calendars, and to its primary correction in the 2300-years' cycle. The subjoined table exhibits this correction. The error amounts to 1 day in 11 lunar cycles, or 209 years, and consequently to 11 days in 11 cycles, when it equals the epact of the 2300th year. The growth of the error and its correction can be seen at a glance in the subjoined table for 2300 years, beginning with the new moon and vernal equinox of B.C. 457, and terminating with the new moon and vernal equinox of A.D. 1844.

The first and last new moon in the 2300-years' cycle preceded the equinox by a single day, but the phasis, or appearance of the new moon, in each case coincided with the day of the equinox.

We terminate our brief examination of cycles connected with the principal calendars by tracing the 42 cycles of the Mohammedan Calendar, which extend from its starting point at the Hejira era, July 16, A.D. 622, to the year 1844. The Mohammedan Calendar is strictly lunar, and is based on a 30-years' cycle of the lunar month and solar day. Thirty lunar years are 360 months, or lunations, each month being reckoned at 29 d. 12 h. 44 m. The fraction 12 h. 44 m., multiplied by 360, amounts to 191 d. 0 h. 0 m. Thus 360 lunations, or 30 lunar years, are 10,631 d. 0 h. 0 m., according to the Mohammedan Calendar, which omits the small remaining fraction of 3 seconds in the length of the lunation.

The first of Moharram in the calendar corresponds with the lunar *phasis*, and is preceded by the actual new moon throughout, as shown in the following table:—

42 LUNAR CYCLES OF THE MOHAMMEDAN CALENDAR.

4. The principal use of the *Tables* is the demonstration they afford of the astronomic character and value of the periods 1,260 and 2,300 years, and of their difference 1,040 years; periods shown to be solar and lunar cycles by the Swiss astronomer, De Cheseaux, more than a century ago.

The present volume of *Tables* confirms the remarkable conclusions reached by De Cheseaux, and greatly enlarges the evidence of the accurate and far-reaching adjustment connecting these periods with solar and lunar revolutions. De Cheseaux proved that 1,260 and 2,300 tropical years, and their difference 1,040 years, are cycles of synodic months and solar or equinoctial years, and that the latter is the largest accurate cycle of this order known, besides being a cycle of the solar day and solar year. The present volume of *Tables* proves that 2,300 years has a cyclical connection with solar and lunar *anomaly*, that it is a cycle of the anomalistic month, with the synodic month and solar year, and also measures 40 days of the *annus magnus* of the revolution of the solar perigee with reference to the equinoxes; and that therefore it is possible to deduce from these periods not only the measures of the synodic month and tropical year, but those of the *anomalistic month and anomalistic year*, and that with such correctness as to afford a basis for the computation of astronomic tables of equinoxes, and new and full moons, both mean and true, for any required period.

More than 100,000 solar and lunar dates, extending over 3,555 years, have been calculated from these remarkable cycles, and are tabulated in this volume; namely 101,217 vernal equinoxes, and new and full moons, mean and true, occupying 627 pages of printed matter. The correctness of the *Tables* is amply confirmed by the correspondence of their dates of new and full moons with those of more than 12,000 solar and lunar eclipses in Oppolzer's invaluable *Canon der Finsternisse*.

Finding M. de Cheseaux's work in the British Museum, and having had it carefully transcribed, I submitted the copy to the examination of the late Professor J. C. Adams, of Cambridge, in the year 1878. While verifying De Cheseaux's calculations as to the cyclical character of the periods 1,260, 2,300, and 1,040 years, Professor Adams pointed out that De Cheseaux had erred in supposing "that the excentricity of the earth's orbit was the same in the time of Daniel as in his own time, whereas it was very sensibly greater." De Cheseaux's error on this point, which arose from the imperfection of astronomic knowledge on the subject in his day, certainly vitiated his attempt to derive from these cycles the five elements of the solar theory; in his own words, to deduce "*les cinq elements de la Theorie du Soleil, d'une manière autant et plus exacte, que par les meilleures methodes astronomiques.*" Within the last century, Laplace, Leverrier, Adams, Hansen, Plana, De Pontécoulant, and other astronomers have devoted much attention to the question of the diminution of the excentricity of the earth's orbit, and have not only established the change of excentricity and measured its rate, but have traced out its cause and its effects; that it is "due to the combined action of all the other planets," and is the cause of *the secular acceleration of the moon's mean motion*, a change which is "one of the most curious and instructive in the range" of physical astronomy, "one which leads our speculations farther into the past and future, and points to longer vistas in the dim perspective of changes which our system has undergone, and is yet to undergo, than any other which observation, assisted by theory, has developed."¹ The moon is now "about a degree ahead of where she ought to have been had her motion been uniform from the time of Hipparchus and Ptolemy."² The investigations of Pro-

¹ *Outlines of Astron.*, Sir J. Herschel, art. 740.

² Newcomb, *Astron.*, p. 96.

fessor Adams have shown that the account received by astronomers of the cause of lunar acceleration was incomplete, and explained only half the acceleration. Delaunay, the French mathematical astronomer, traced the remaining effect to "tidal friction" as reducing the rate of the earth's axial revolution.

A consequence of the secular acceleration of the moon's mean motion is that the value of the synodic month, generally accepted by astronomers in the present day, 29*d.* 12*h.* 44*m.* 2·84*s.*, or 29·5305887 days, yields results which *require correction* for distant periods, past or future. It is impossible to assign any period as the exact measure of the synodic month which will hold good for all time. In adopting as the measure of the synodic month, at the base of the present *Tables*, a period slightly larger than the above, derived directly from the 1,040 years' cycle, viz., 29*d.* 12*h.* 44*m.* 3*s.* 6*thirds*, or 29·5305916,¹ we employ a measure which, in the absence of any correction for secular inequalities, *yields better results*² than the best and most accurate measures of the lunation now used by astronomers.

In illustration of this we may point to the dates in the present *Tables* of the mean new moons in the fourth century, when the Christian Calendar now in use took its rise. Calculating the date of the first mean new moon in A.D. 301 (Jerusalem civil time) by the tables in the *Encyclopædia Britannica*, and *correcting for secular inequalities*, we reach results which closely agree with the date of the mean new moon in our *Tables*.

¹ Exceeding 29·5305887 by ·0000029, a fraction of a single second.

² For past dates.

| | | <i>d.</i> | <i>h.</i> | <i>m.</i> | <i>s.</i> |
|-------------|-------------------|-----------|-----------|-----------|-----------|
| A.D. 1801. | January | 14 | 7 | 39 | 9 |
| — 1500. | | 11 | 12 | 25 | 59 |
| | | 25 | 20 | 5 | 8 |
| Correction, | Long. Jerusalem | + | 2 | 21 | 0 |
| „ | Civil Time . . . | + | 12 | 0 | 0 |
| | | 26 | 10 | 26 | 8 |
| Correction, | Secular Equations | — | 1 | 18 | 33 |
| A.D. 301. | January | 26 | 9 | 7 | 35 |

On comparing the result here with our *Tables*, we find a close agreement with our *uncorrected mean new moon* for the same date. The first mean new moon, A.D. 301, in our *Tables* is January 26*d.* 9*h.* 7*m.* The agreement of our mean new moon with the *corrected* mean new moon of the *Encyclopædia Britannica*, proves that the 1,040 years' cycle, from which we derive our measures, is closely adjusted to the chronology of the century distinguished by the institution of the Christian Calendar.¹

In order to show this fact we have calculated by the astronomical tables in the *Encyclopædia Britannica*, 7th edition, the date of the first mean new moon in each century from A.D. 1801 to B.C. 800, *applying in every case the secular corrections*, which run from 0*h.* 0*m.* 0*s.* in 1801, to 3*h.* 52*m.* 5*s.* in B.C. 800. We have then compared the series of dates thus obtained with the mean new moons in our *Tables* for the same period, and find the following differences :—

¹ The date of the Council of Nice was A.D. 325.

FIRST MEAN NEW MOON IN EACH CENTURY.

DIFFERENCES OF THE DATES IN OUR *TABLES* FROM THOSE CALCULATED FROM
TABLES IN *ENCYCLOPÆDIA BRITANNICA*, CORRECTED BY SECULAR EQUATIONS.

The adjustment of the measures of the lunation derived from the 1,040 years' cycle to the uses of the Christian Calendar is proved by the fact that *the error resulting from their employment nowhere exceeds 20 minutes*. Employing these measures, and starting with the month of March, A.D. 1844, we reach an error of 2 minutes in 1801; the error grows to 20 minutes in A.D. 1101, and then diminishes to 0*h.* 0*m.* in A.D. 301, increasing again to 18½ minutes in A.D. 1.

In computing the long series of lunar dates contained in our *Tables*, the saving of time and labour by *dispensing with the use of secular equations* has been very great. When employing our *Tables*, those who are desirous of greater accuracy than they afford can apply the needed corrections, but the errors we have indicated may well be considered as

too small to affect injuriously the value of the *Tables* for all ordinary chronological purposes.

On page xvii. the first solar eclipse of each century from B.C. 1100 to A.D. 1900, as stated in Oppolzer's *Canon*, is compared with the corresponding true new moon of our *Tables*. It will be observed that while the mean difference between the two series of new moons is -10 minutes, the *minus* differences prevail in the second half of the series, and the *plus* differences in the first half. This agrees with the result we have just exhibited of employing a measure of the synodic month derived from the 1,040 years' cycle, exceeding by a fraction of a second that used by Oppolzer and other modern astronomers. Though thus slightly exceeding the lunation of the most modern tables, our measure of the synodic month is in fairly close agreement with the lunation of lunar tables of a little older date.

LUNATION.

| From 1,040 Years' Cycle | 29 | 12 | 44 | 3 | 6 | 57 |

10,000 LUNATIONS.

| | <i>d.</i> | <i>h.</i> | <i>m.</i> | <i>s.</i> | <i>'''</i> |
|-------------------------|-----------|-----------|-----------|-----------|------------|
| Ferguson's Tables . . | 295,305 | 21 | 48 | 15 | 20 |
| From 1,040 Years' Cycle | 295,305 | 21 | 59 | 19 | 8 |

The mean of the lunations used by Cassini, Flamsteed, De la Hire, Bouillaud, Tycho, etc., as shown by De Cheseaux, has no sensible difference from the measure yielded by the 1040 years' cycle.

A word in conclusion as to the labour and care with which the present *Tables* have been computed. The whole of the new moons from B.C. 747 to A.D. 1934, and also of the vernal equinoxes for the same period, have been *twice computed*, and the results carefully compared throughout.

The first calculation of the true new moons was made on Houzeau's method "du calcul rapide des phases lunaires, à l'usage des personnes qui s'occupent d'études historiques," based on the 7,412 days' anomalistic cycle, containing 251 synodic and 269 anomalistic months. This extensive table was calculated for me under the supervision of E. Walter Maunder, Esq., F.R.A.S., Secretary of the Royal Astronomical Society. Though valuable as a first draft, and as a means of checking the correctness of later work, the table, owing to its method of calculation, was less accurate than that presented in this volume; it was also less extensive, as commencing with B.C. 747 (date of the Nabonassar Era), whereas the present *Tables* ascend 875 years further to the probable date of the Exodus, B.C. 1622.

In the preparation of the present *Tables* I have had the assistance of a very careful computer, Mr. Thomas Wright, of the Nautical Almanac Office, who has also corrected the proofs as the work passed through the press. As an indication of the general accuracy of the work I may refer to the test of the mean new moons of the tables afforded by the 1040 years' cycle. Applied at any point the lunar cycle of 1,040 years shows a correspondence of the mean new moons at its commencement and close. The anticipation of the Julian equinox in 1,040 years is just 8 days; allowing for this, it will be found that the new moons correspond with remarkable accuracy.

CORRESPONDENCE OF MEAN NEW MOONS IN THE
1040 YEARS' LUNAR CYCLE.

We will close this Introduction by citing the testimony of one or two competent witnesses as to the intimate connection of Natural and Revealed Chronology.

In the chapter on Chronological Astronomy, contained in the fourth edition of his *Handbook of Astronomy*, George F. Chambers, F.R.A.S., after giving an account of De Cheseaux's discoveries brought under public notice in my works, and also of some of my investigations in the same direction, adds the following reflections: "Such are some of the adjustments which astronomy discloses between the prophetic times and the periods which affect the material universe. They are adjustments of such a character as only modern science, with its instruments of exact precision, could discover, and were of necessity unknown to the prophets of bygone ages. The periods which the prophets foretold as destined to measure cycles of moral harmonization are themselves cycles of material harmonization. There is a mutual adjustment between the material and moral worlds. The course of revealed Redemption chronology, Levitical and Prophetic, is in profound and exact agreement in all its details and all its extent with the Time Order of the Universe."¹

We will conclude with a sentence from De Cheseaux's treatise on the astronomical character of the prophetic times in the Book of Daniel. "For many ages the Book of Daniel, and especially these passages of it, have been quoted and commented on by numerous and varied authors, so that it is impossible for a moment to call in question their antiquity. Who can have taught their author the marvellous relation of the periods he selected with soli-lunar revolutions? Is it possible, considering all these points, to fail to recognise in the Author of the Book of Daniel, the Creator of the heavens and all their hosts, of the earth and the things that are therein?"

¹ Vol. II., p. 467.

SUPPLEMENTARY NOTES BY MR. MARTH ON THE
EQUINOX DATES, AND LENGTH OF THE EQUI-
NOCTIAL YEAR.

THE Vernal Equinoxes in this volume are all *mean* Vernal Equinoxes. A Table has been computed by Mr. Marth, which we append, to exhibit the correction they require for the times (approximately stated) of the *true* Vernal Equinoxes.

“What is the real time of the Equinox? It is the time when the plane of the Earth’s equator apparently passes through the Sun’s centre, or when the geocentric declination of the Sun is 0° . About the time of the Equinox the hourly rate of change of declination is about $1'$, or in one minute of time the declination changes about $1''$. The determination of the time of the Equinox is accordingly a rather complicated problem, and Bradley’s observations in the middle of the last century are really the first which nowadays can be used, the remaining errors at the Vernal Equinox being fortunately counteracted by those of the Autumnal Equinox. The differences of the times of successive Equinoxes vary considerably, as may be easily found by comparing the times given in the *Nautical Almanac* up to 1875, since later on the times are only given to the nearest hour. Yet the length of the sidereal solar year does not change, and that of the tropical year only changes on account of the precession changing. For the solar year is determined by the Sun’s *mean* longitudes reckoned from the mean Equinox, and these are deduced from the observed longitudes by taking all the perturbations, and especially the eccentricity, of the earth’s orbit duly into account. If all the smaller perturbations are neglected, and only the eccentricity and the shifting of the perigee are taken into account, the times between successive Vernal and Autumnal Equinoxes and the length of the tropical year may be found in the following

computation deduced from Le Verrier's Tables, which are certainly the most trustworthy at present, though they may be supplanted before long by Newcomb's new ones, which will take into account the observations of the last forty years. By looking over the differences of the Equinoxes, it is seen that for the Vernal Equinoxes the differences increase, as they have done since B.C. 3000, when they were at a minimum 48^m 20^s·8; while the differences of the Autumnal Equinoxes decrease rather faster than the length of the tropical year."

LENGTH OF THE TROPICAL YEAR AT DIFFERENT DATES, COMPUTED FROM LEVERRIER'S TABLES."

VERNAL EQUINOX DIFFERENCES.

The differences of the times are rather variable, as a comparison of the times given in the *Nautical Almanac* shows.

| Vernal Equinoxes. | | | | | | | Differences. |
|-------------------|---|---|-------|----|----|----|--------------|
| | | | d. | h. | m. | | m. |
| 1836 | . | . | March | 20 | 1 | 39 | Greenwich. |
| 1840 | . | . | " | " | 0 | 41 | —58 |
| 1844 | . | . | " | 19 | 23 | 55 | —46 |
| 1848 | . | . | " | " | 23 | 19 | —36 |
| 1852 | . | . | " | " | 22 | 42 | —37 |
| 1856 | . | . | " | " | 21 | 49 | —53 |
| 1860 | . | . | " | " | 21 | 5 | —44 |
| 1864 | . | . | " | " | 20 | 10 | —55 |
| 1868 | . | . | " | " | 19 | 43 | —27 |
| 1872 | . | . | " | " | 18 | 57 | —46 |

If one is content to get the times within some twenty minutes, so that the places of the moon and planets need not be taken into consideration, the computation becomes simple, and requires merely proper interpolation, as the data can be taken from R. Schram's "*Hilfstafeln für Chronologie*," in vol. xlv. of the *Denkschriften* of the Vienna Academy. In the following computation I give the list of the days when the sun enters Aries from Schram's Tables, after having converted the days of the Julian period into those of the ordinary Julian Calendar. The intervals of 42,002·8 days are those of 115 years, so that the correction is best effected by interpolating for intervals of twenty-three years, or for five sub-intervals, taking the second differences duly into account, and then interpolating for the single years. The comparison of the resulting times with those of the Tables shows the correction required by the latter in the last column.

TABLE OF CORRECTIONS OF THE MEAN VERNAL
EQUINOXES OF THIS VOLUME FOR DATES OF
TRUE VERNAL EQUINOXES.

R. Schram, "Hilfstafeln für Chronologie." P. 10.

The dates in the first column are reduced from days of the Julian
Period to the dates of the Julian calendar, and .6153 is added (.59791
=14 h. 21 m. for the reduction from Greenwich astronomical time to
Jerusalem Civil Time, and .01738 for the added constants).

DATES OF EQUINOXES AND SOLSTICES, B.C. 552.

“I have computed the times of the Equinoxes and Solstices for the year B.C. 552, and find they agree with those of Schram. When were Professor Adams’ computations made? or what Tables did he employ? By Schram’s Tables, taking into account the six smaller terms, I find—

| | | | d. | h. | m. | |
|------|------------------|---------|----|----|----|-----------------------|
| B.C. | Vernal Equinox | . March | 27 | 11 | 31 | Jerusalem Civil Time. |
| | Summer Solstice | . June | 29 | 15 | 6 | |
| | Autumnal Equinox | . Sept. | 29 | 15 | 33 | |
| | Winter Solstice | . Dec. | 27 | 4 | 0 | |

NOTES ON PROFESSOR ADAMS’ COMPUTATION.

The examination of De Cheseaux’ calculations by Professor Adams as to the dates of the Equinoxes and Solstices B.C. 552, was made for the author of the present work in 1878. In a

letter published at the time in the introduction to *The Approaching End of the Age*, Professor Adams says :—

“I have calculated very approximately the times of the Equinoxes and Solstices for the year B.C. 552, which is that given by De Cheseaux as the year of Daniel’s vision, and I find the following results expressed in mean time at Jerusalem, reckoned from midnight.

| | | | <i>d.</i> | <i>h.</i> | <i>m.</i> |
|------------------|---|---|-----------|-----------|-----------|
| Vernal Equinox | . | . | March 27 | 8 | 2 |
| Summer Solstice | . | . | June 29 | 11 | 39 |
| Autumnal Equinox | . | . | Sept. 29 | 11 | 51 |
| Winter Solstice | . | . | Dec. 27 | 0 | 17 |

Professor Adams did not mention what Tables he employed. On the variance of the two computations, Mr. Marth writes, “A difference of $3\frac{1}{2}$ or $3\frac{3}{4}$ hours seems due to some error which may indeed occur in sporadic computations if one does not check them in several ways. I have tried to find the cause of the discrepancy, but have not succeeded in hitting upon a plausible conjecture which might serve as an explanation.”

MEAN AND TRUE LONGITUDE OF THE SUN AT THE NABONASSAR ERA, COMPUTED BY MR. MARTH.

“I have computed from Leverrier’s Solar Tables the place of the Sun for—746, February 26th (B.C. 747), and find,—

| | | | Alexandria, noon. |
|--------------------|---|---|----------------------|
| Mean Longitude | . | . | 327° 58' 31·7" |
| Equation of Centre | . | . | +2° 2' 42·0" |
| True Longitude | . | . | <u>330° 1' 13·7"</u> |

“The equation of the centre is near its maximum, the perigee being in $236^{\circ} 12' 5''$, and the eccentricity was at that time greater than at present.

“A. MARTH.”
